

IPO valuation versus revenue

AAOI, Acacia and Infinera · both axes in July 2026 dollars

Revenue: latest disclosed trailing 12 months before IPO; full year minus prior interim plus current interim.

Valuation: IPO offer price × post-offering basic shares; excludes the underwriters' additional-share option and unissued awards.

Both coordinates use IPO-month CPI, preserving nominal revenue multiples; July 2026 CPI-U = 333.918.

Infinera deferred substantial bundled-product revenue. Its GAAP-revenue multiple does not measure its shipment-value multiple.

Dashed lines show constant valuation/revenue ratios, not a fitted relationship. Three observations do not establish a valuation model.
